In a Journal of Advanced Nursing study of 90 adults with type 2 diabetes, female gender, elevated blood sugar levels, neuropathic pain, and fatigue were related to sleep disturbance, even after controlling for factors such as age, diabetes duration, depressive symptoms, and distress.

The findings suggest that clinicians should pay extra attention to females when conducting sleep-related assessments. A comprehensive sleep evaluation should also include diabetes-related symptoms such as neuropathic pain and fatigue. “Sleep disturbance in patients with diabetes is common and may negatively affect blood glucose,” said senior author Dr. Cynthia Fritschi, of the University of Illinois at Chicago College of Nursing. “A thorough sleep assessment, especially in female adults, must include a symptom assessment. To do otherwise limits our ability to treat sleep disturbance effectively in this population.”

Additional Information

About Journal

The Journal of Advanced Nursing (JAN) contributes to the advancement of evidence-based nursing, midwifery and healthcare by disseminating high quality research and scholarship of contemporary relevance and with potential to advance knowledge for practice, education, management or policy.

All JAN papers are required to have a sound scientific, evidential, theoretical or philosophical base and to be critical, questioning and scholarly in approach. As an international journal, JAN promotes diversity of research and scholarship in terms of culture, paradigm and healthcare context. For JAN’s worldwide readership, authors are expected to make clear the wider international relevance of their work and to demonstrate sensitivity to cultural considerations and differences.
