A new Journal of the American Geriatrics Society article reviews common issues in caring for the sexual health of older women, noting that physicians often lack sufficient training.

Only a minority of older women report discussing sexual issues with a physician, and when discussions do occur, they are usually initiated by the patient. Physicians should ask regularly and proactively about sexual activity and function.

Important interventions include offering practical advice to common chronic medical conditions and sexual problems that confront older women; treating vulvovaginal atrophy; and providing screening, prevention strategies, and treatment for sexually transmitted infections when appropriate.

“Sexuality in older women has been systematically ignored. We know older women are sexually active and interested in sex—that’s the most important reason for physicians and other healthcare providers to feel comfortable about addressing sexual issues in older women,” said co-author Dr. Janet Pregler, of the David Geffen School of Medicine at the University of California, Los Angeles. “From a public health perspective, sexually transmitted infections are increasing in older women. That’s important, too.”

About Journal

Included in more than 9,000 library collections around the world, JAGS is the go-to journal for clinical aging research. We provide a diverse, interprofessional community of healthcare professionals with the latest insights on geriatrics education, clinical practice, and public policy—all supporting the high-quality, person-centered care essential to our well-being as we age.

Our rigorous peer-review process ensures that we bring healthcare professionals, older adults, and caregivers research with the potential to impact public policy and geriatrics care today—and tomorrow. Since the publication of our first edition in 1953, JAGS has remained one of the oldest and most impactful journals dedicated exclusively to gerontology and geriatrics.
