A new analysis reveals that for most women, the risk of dying from cervical cancer is higher than previously thought. Unlike prior estimates that also included women who had undergone a hysterectomy and were therefore no longer at risk, this analysis only included women with a cervix. Published early online in *CANCER*, a peer-reviewed journal of the American Cancer Society, the study also revealed significant racial differences in the risk of dying from cervical cancer.

To re-examine cervical cancer mortality rates from 2002 to 2012 in the United States, Anne Rositch, PhD, MSPH, of the Johns Hopkins Bloomberg School of Public Health, and her colleagues obtained estimates from the National Center for Health Statistics and the NCI Surveillance, Epidemiology, and End Results Mortality Database. Information on hysterectomy prevalence was gathered from the Behavioral Risk Factor Surveillance System survey to remove the large fraction of women who were not at risk of dying from cervical cancer.

The researchers found that black women in the United States are dying from cervical cancer at a rate 77 percent higher than previously thought, while white women are dying at a rate 47 percent higher. Specifically, the corrected mortality rate in black women was 10.1 per 100,000 women, compared with 5.7 per 100,000 uncorrected. The corrected rate in white women was 4.7 per 100,000 compared with 3.2 per 100,000 uncorrected.

Also, without the correction, the disparity in mortality between races was underestimated by 44 percent. In addition, an analysis of the corrected rates over the decade revealed that white women’s rates of death from cervical cancer decreased by 0.8 percent per year, compared with an annual decrease of 3.6 percent in black women.

“Although trends over time show that the racial disparity in cervical cancer mortality is closing, these data emphasize that it should remain a priority area,” said Dr. Rositch. “In addition, many of those who are dying are over the age of 65, a cutoff point where guidelines generally no longer recommend women with cervices be regularly screened for cervical cancer;” she added.

An accompanying editorial by Heather Dalton, MD, of Arizona Oncology, and John Farley, MD, of St. Joseph’s Hospital and Medical Center, highlights the effort that is needed going forward. “Racial disparities in cancer mortality in general and cervical cancer specifically continue to be a vexing problem in the United States,” they write. “Access to adequate cervical cancer screening and preventative care remains critical to eliminating racial disparity.”

About the Journal

CANCER is a peer-reviewed publication of the American Cancer Society integrating scientific information from worldwide sources for all oncologic specialties. The objective of CANCER is to provide an interdisciplinary forum for the exchange of information among oncologic disciplines concerned with the etiology, course, and treatment of human cancer. CANCER is published on behalf of the American Cancer Society by Wiley and can be accessed online at http://wileynonlibrary.com/journal/cancer.

About Wiley

Wiley, a global company, helps people and organizations develop the skills and knowledge they need to succeed. Our online scientific, technical, medical, and scholarly journals, combined with our digital learning, assessment and certification solutions help universities, learned societies, businesses, governments and individuals increase the academic and professional impact of their work. For more than 200 years, we have delivered consistent performance to our stakeholders. The company’s website can be accessed at www.wiley.com.
