NSAIDs May Be More Effective Than Paracetamol For Period Pain

Release Date: Wednesday, January 20, 2010 5:43 am EST

Summary:
Non-steroidal anti-inflammatory drugs (NSAIDs) like ibuprofen may be more effective for relieving period pain than paracetamol, according to the update of a Cochrane Review. However, it remains unclear whether any one NSAID is safer or more effective than others.

Period pain affects a high proportion of women: up to 72% in a recent Australian survey of 16-49 year olds. It is thought to be caused by an excess or imbalance of certain hormones released by the body during menstrual periods, including one called prostaglandin. NSAIDs such as ibuprofen, aspirin, and naproxen are commonly used for period pain.

The updated review includes data from 73 trials carried out in 18 different countries and involving a total of 5,156 women. The trials compared NSAIDs with placebo, with each other, and with paracetamol. The review shows that NSAIDs are very effective for treating period pain compared with placebo. This applied to all NSAIDs tested except aspirin, for which there was only limited evidence of effectiveness. Due to the large number of different NSAIDs tested in the trials, no one drug emerged as more safe or effective than the rest.

The review also provides some evidence that NSAIDs are significantly more effective than paracetamol, though there were only three relevant studies. Until now there has been no evidence that NSAIDs work any better than paracetamol, and a previous Cochrane Review published in 2003 concluded that there was no evidence of any difference.

Overall, NSAIDs were shown to carry a significantly increased risk of adverse effects compared to placebo. Adverse effects can include indigestion, headaches, and drowsiness. “Women using these drugs need to be aware of the side effects,” said lead author Jane Marjoribanks, who works with the Cochrane Menstrual Disorders and Subfertility Group in Auckland, New Zealand. “It would be interesting to see whether these could be reduced, without loss of effectiveness, by combining lower doses with other drugs such as paracetamol, or with other therapies such as transcutaneous electrical nerve stimulation.”

Additional Information

About Journal

Cochrane is a global independent network of researchers, professionals, patients, carers, and people interested in health. Cochrane produces reviews which study all of the best available evidence generated through research and make it easier to inform decisions about health. These are called systematic reviews.

Cochrane is a not-for-profit organization with collaborators from more than 130 countries working together to produce credible, accessible health information that is free from commercial sponsorship and other conflicts of interest. Our work is recognized as representing an international gold standard for high quality, trusted information.

About Wiley
Wiley, a global company, helps people and organizations develop the skills and knowledge they need to succeed. Our online scientific, technical, medical, and scholarly journals, combined with our digital learning, assessment and certification solutions help universities, learned societies, businesses, governments and individuals increase the academic and professional impact of their work. For more than 200 years, we have delivered consistent performance to our stakeholders. The company’s website can be accessed at www.wiley.com.
