In an analysis of published studies, lower levels of alcohol consumption were associated with a lower risk of abdominal aortic aneurysm until approximately 15 to 20 g/day, with an increasing risk thereafter.

In an analysis of published studies, lower levels of alcohol consumption were associated with a lower risk of abdominal aortic aneurysm until approximately 15 to 20 g/day, with an increasing risk thereafter. In the British Journal of Surgery analysis, the increase in risk beyond 2 units/day was stronger in men than in women.

An abdominal aortic aneurysm occurs when an area of the aorta—the main blood vessel that supplies blood to the abdomen, pelvis, and legs—becomes very large or balloons out. There are well established risk factors for the development of abdominal aortic aneurysm—such as increasing age, male sex, and smoking—but the role of alcohol remains uncertain.

The analysis combined results from 11 large prospective cohort studies, including more than 3500 cases identified from nearly 500,000 participants, followed-up for between 5 and 34 years.

"The association is fairly weak and the evidence is not strong for alcohol either decreasing or increasing the risk of abdominal aortic aneurysm by very much," said Dr. Darren Greenwood, senior author of the study. "If people want to stay healthy and active for longer, the biggest improvement they can make is to quit smoking."

Additional Information

About Journal
With an impact factor of 4.839, BJS is the premier surgical journal in Europe and one of the top six surgical periodicals in the world. Its international readership is reflected in the prestigious international Editorial Board, supported by a panel of over 1200 reviewers worldwide. BJS features the very best in clinical and laboratory-based research on all aspects of general surgery and related topics. Developing areas such as minimally invasive therapy and interventional radiology are strongly represented. The inclusion of Leading articles, Reviews and Original Articles means that the BJS offers an appropriate format for any length or type of submission. In addition there are abstracts from key meetings, correspondence, and book reviews. BJS will be of interest not only to general surgeons, but also to specialty surgeons and those working in related fields.
