New research published in Epilepsia, a journal of the International League Against Epilepsy (ILAE), indicates that wristband devices may improve the detection and characterization of seizures in patients with epilepsy.

New devices are needed for monitoring epileptic seizures, especially those that can lead to sudden death. While rare, “sudden unexpected death in epilepsy” (SUDEP) is the most common cause of death in epilepsy, and it often occurs at night. The gold standard for monitoring seizures—video-electroencephalography—is available in epilepsy monitoring units but is an impractical procedure for daily life use. Therefore, clinicians often rely on patients and caregivers to report seizure counts, which are often inaccurate.

In their attempts to develop a better monitoring method, Giulia Regalia, PhD and Francesco Onorati, PhD, of Empatica Inc. in Milan, Italy and Cambridge, Massachusetts, and their colleagues examined the potential of automated, wearable systems to detect and characterize convulsive epileptic seizures. The researchers used three different wristbands to record two signals—called electrodermal activity and accelerometer signals—that usually exhibit marked changes upon the onset of convulsive seizures, obtaining 5928 hours of data from 69 patients, including 55 convulsive epileptic seizures from 22 patients.

The wristband detectors showed high sensitivity (95% of seizures were detected) while keeping the false alarm rate at a bearable level (on average, one false alarm every four days), which improves a pioneering 2012 study led by MIT professor Rosalind Picard, now chief scientist at Empatica.

In addition to detecting seizures, the method also revealed certain characteristics of the seizures, which may help alert clinicians and patients to seizures that are potentially dangerous and life-threatening.

“The present work provides significant improvements for convulsive seizure detection both in clinical and ambulatory real-life settings,” said Dr. Regalia. “Accurate seizure counts with real-time alerts to caregivers allows an early application of aid, which can be protective against SUDEP risk.” She noted that the wristband detectors do not require caregivers to be near patients continuously, which could significantly improve patients and caregivers’ quality of life.

About the Journal
Epilepsia is the leading, most authoritative source for current clinical and research results on all aspects of epilepsy. As the journal of the International League Against Epilepsy, subscribers every month will review scientific evidence and clinical methodology in: clinical neurology, neurophysiology, molecular biology, neuroimaging, neurochemistry, neurosurgery, pharmacology, neuropsychology and therapeutic trials. For more information, please visit http://onlinelibrary.wiley.com/journal/10.1111/(ISSN)1528-1167
About Wiley
Wiley, a global research and learning company, helps people and organizations develop the skills and knowledge they need to succeed. Our online scientific, technical, medical, and scholarly journals, combined with our digital learning, assessment and certification solutions help universities, learned societies, businesses, governments and individuals increase the academic and professional impact of their work. For more than 210 years, we have delivered consistent performance to our stakeholders. The company's website can be accessed at www.wiley.com.
